Notice

Please note that the Intel® Acceleration Stack for Intel Xeon® CPU with FPGAs **DOES NOT** include mitigations for the exploits known as Spectre (CVE-2017-5753, CVE-2017-5715) and Meltdown (CVE-2017-5754). These exploits require that malware runs locally on the system, which is not normally possible in a closed environment where the system's software is centrally controlled. Intel does not recommend that an un-mitigated version of the Intel Acceleration Stack for Intel Xeon CPU with FPGAs be used in an environment that is not a closed system environment.

Intel Acceleration Stack for Intel Xeon CPU with FPGAs Version 2.0.1 Release Notes for the Intel FPGA PAC D5005

This document provides up-to-date information about the Intel Acceleration Stack for Intel Xeon CPU with FPGAs version 2.0.1 release for the Intel FPGA PAC D5005.

Acceleration Acronym List

Use the following table as a reference when reviewing the release notes.

Table 1. Acronyms

Acronyms	Expansion	Description
AFU	Accelerator Functional Unit	Hardware Accelerator implemented in FPGA logic which offloads a computational operation for an application from the CPU to improve performance.
AF	Accelerator Function	Compiled Hardware Accelerator image implemented in FPGA logic that accelerates an application. An AFU and associated AFs may also be referred to as GBS (Green-Bits, Green BitStream) in the Acceleration Stack installation directory tree and in source code comments.
ASE	AFU Simulation Environment	Co-simulation environment that allows you to use the same host application and AF in a simulation environment. ASE is part of the Intel Acceleration Stack for FPGAs.
FIM	FPGA Interface Manager	The FPGA component containing the FPGA Interface Unit (FIU) and external interfaces for memory, networking, etc. The FIM may also be referred to as BBS (Blue-Bits, Blue BitStream) in the Acceleration Stack installation directory tree and in source code comments. The Accelerator Function (AF) interfaces with the FIM at run time.
HSSI	High-speed Serial Interface	Reference to the multi-gigabit serial transceiver I/O in the FIM and the corresponding interface to the Accelerator Functional Unit (AFU).
<i>continued...</i>		

Acronyms	Expansion	Description
OPAE	Open Programmable Acceleration Engine	The OPAE is a software framework for managing and accessing AFs.
PIM	Platform Interface Manager	An abstraction layer for managing top-level device ports and system-provided clock crossing.
PR	Partial Reconfiguration	The ability to dynamically reconfigure a portion of an FPGA while the remaining FPGA design continues to function.

Minimum Requirements

The minimum requirements for the Intel FPGA Programmable Acceleration Card D5005 are:

- Intel Xeon Scalable processor
- A PCI Express* x16 Slot
- 128 GB of free memory is a requirement only if you are compiling a hardware design
- Operating System:
 - Red Hat* Enterprise Linux* (RHEL) version 7.6 Kernel 3.10.0-957
- PACSign tool requires Python 3.0
- OPAE tools require Python 2.7
- OpenCL* RTE version 19.2.0.57

Intel Acceleration Stack v2.0.1 Reference Table

Table 2. Intel Acceleration Stack Best Known Configuration

Note: When the image in the user partition cannot be loaded, a flash failover occurs and the factory image is loaded instead. After a flash failover occurs, the PR ID reads as 9346116d-a52d-5ca8-b06a-a9a389ef7c8d.

Intel Acceleration Stack Version	Platform	FPGA Interface Manager (FIM) Version: Partial Reconfiguration (PR) Interface ID	Open Programmable Acceleration Engine (OPAE) Version	Intel Quartus® Prime Pro Edition	Board Management Controller (BMC) RTL version	BMC firmware version
2.0.1	Intel FPGA PAC D5005	9346116d-a52d-5ca8-b06a-a9a389ef7c8d	1.1.4-8	19.2	2.0.6	2.0.12
2.0	Intel FPGA PAC D5005	bfac4d85-1ee8-56fe-8c95-865ce1bbaa2d	1.1.4-3	18.1.2	1.0.15	1.0.12

Intel Acceleration Stack v2.0.1 Features

Table 3. Features of the Intel Acceleration Stack v2.0.1

Feature	Description
Security Enhancements	<ul style="list-style-type: none"> • Intel MAX[®] 10 Root-of-Trust Implementation • Support for BMC firmware, BMC RTL, FIM, and AFU signing • New OPAE security tools: <ul style="list-style-type: none"> – FPGA one-time secure update (<code>fpgaotsu</code>): Upgrades from v2.0 to v2.0.1 – FPGA secure update (<code>fpgasupdate</code>): Remotely updates bitstreams securely. <code>fpgasupdate</code> replaces <code>fpgaflash</code>. – Super-RSU (<code>super-rsu</code>): Supports v2.0.1 package updates (BMC RTL/firmware and FPGA image). – PACSign: Enables signing of bitstreams. To use this tool, you must have the capability to generate a public/private key pair and your hardware security module (HSM) must support a Public-Key Cryptography Standards (PKCS)#11 compatible application programming interface (API) to the PACSign tool.
CCI-P Byte Enable	Supports programmable byte writes less than 1 cache line in length. Refer to the <i>Intel Acceleration Stack for Intel Xeon CPU with FPGAs Core Cache Interface (CCI-P) Reference Manual</i> for more details.
Networking Interface	<ul style="list-style-type: none"> • Interface supports 32-bit PCS direct mode (PMA only). • 10 GbE MAC AFU is not provided. • Pseudo-random bit stream generator (PRBS) AFU provided to test interface.
Sample AFUs Supported	<p>The following unsigned AFU examples are provided with the Intel Acceleration Stack for Intel Xeon CPU with FPGAs:</p> <ul style="list-style-type: none"> • <code>dma_afu_unsigned.gbs</code> • <code>streaming_dma_afu_unsigned.gbs</code> • <code>hello_afu_unsigned.gbs</code> • <code>hello_mem_afu_unsigned.gbs</code> • <code>hello_intr_afu_unsigned.gbs</code> • <code>nlb_mode_0_unsigned.gbs</code> • <code>nlb_mode_0_stp_unsigned.gbs</code> • <code>nlb_mode_3_unsigned.gbs</code> • <code>byte_enable_afu_unsigned.gbs</code> • <code>hssi_prbs_unsigned.gbs</code> <p><i>Note:</i> Each *_unsigned.gbs above is prepended with the necessary block0 and block1 headers but there are no hashes in these headers that have been signed with the root and code signing keys. To learn how to securely sign a provided *_unsigned.gbs refer to the <i>Intel Acceleration Stack Quick Start Guide: Intel FPGA Programmable Acceleration Card D5005</i>.</p>

Known Issues for the Intel Acceleration Stack v2.0.1

Table 4. Known Issues for the Intel Acceleration Stack v2.0.1

Known Issue	Details
<p>The Intel FPGA PAC D5005 may be unable to recover after an AFU fails to load onto the card. This issue can occur if a *.gbs file is not signed with the correct key or if a *.gbs file is corrupted.</p>	<ul style="list-style-type: none"> When the AFU fails to load on the card, you see this error message: <pre data-bbox="787 478 1409 632"> WARNING] Update starting. Please do not interrupt. libopae-c reconf.c:427:fpgaReconfigureSlot() **ERROR** : Failed to reconfigure bitstream: Input/output error libopae-c reconf.c:455:fpgaReconfigureSlot() **ERROR** : PR IP protocol error detected Error writing bitstream to FPGA: reconfiguration error [2019-11-01 18:23:40,172] [ERROR] Partial Reconfiguration failed </pre> Workaround: To recover after loading a corrupted or incorrectly signed AFU onto the Intel FPGA PAC D5005, power cycle the card. Status: This limitation will be fixed in a future version of the Intel Acceleration Stack.
<p><code>fpgabist -i</code> does not check device ID or report errors on incorrect device ID.</p>	<ul style="list-style-type: none"> Workaround: None available. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>Invalid memory read fault may cause FIM to lock.</p>	<ul style="list-style-type: none"> The FIM locks after the AFU sends a memory read to invalid address. <ul style="list-style-type: none"> When using <code>fpgainfo</code>, this error displays as <code>compStatErr</code>. When using <code>sudo lspci -vvs B:D.F</code> this error displays as <code>TransPend+entry</code> under <code>DevSta</code>. Workaround: Power cycle the card to reinitialize the Intel FPGA PAC and recover from this issue. Refer to the Knowledge Base entry for more information. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>The Intel FPGA PAC D5005 may report that a non-fatal error has occurred during boot.</p>	<ul style="list-style-type: none"> This error is not seen if you are using OPAAE drivers. If you do not have the OPAAE drivers installed, the Intel FPGA PAC D5005 responds to configuration read requests to functions that do not exist by returning <code>NonFatalErr+</code> error responses. You can clear and ignore these errors after boot. Workaround: If you are not using the OPAAE driver to handle this error, you can clear the relevant errors at boot: <pre data-bbox="787 1297 1409 1325"> sudo setpci -s BDF ECAP_AER+0x10.L=0xFFFFFFFF </pre> Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>QSFP link and activity LEDs do not reflect Ethernet link status.</p>	<ul style="list-style-type: none"> Workaround: None available. Status: Fix targeted for a future version of the board management controller firmware.

continued...

Known Issue	Details
<p>PACSign tool requires Python* version 3.x software to be in <code>/usr/bin</code>.</p>	<ul style="list-style-type: none"> Although the PACSign tool requires Python version 3.x software to be in <code>/usr/bin</code>, installation from a local zip file typically results in the software being installed to <code>/usr/local/bin</code>. Workaround: When installing from source, complete the following commands: <pre data-bbox="760 443 1386 548">tar zxvf Python-3...tgz cd Python-3... ./configure --prefix=/usr make sudo make install</pre> to install the tool in the correct directory. If you have already installed in <code>/usr/local/bin</code>, you can invoke the PACSign command using <code>python3 /usr/local/bin/PACSign</code>. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>When virtual functions (VF) or physical functions (PF) send multiple unaligned read or write requests to the Intel FPGA PAC D5005 registers, the host reboots.</p>	<ul style="list-style-type: none"> This issue only exists when using Red Hat* Enterprise Linux (RHEL) version 7.6 Kernel 3.10.0-957. Workaround: None available. Status: This limitation is addressed in newer Linux kernels. Intel recommends upgrading from the Red Hat* Enterprise Linux (RHEL) version 7.6 Kernel 3.10.0-957 kernel. No fixes are planned for this version of the kernel.
<p>The Intel FPGA PAC D5005 does not support optical module cables that require the <code>ResetL</code> pin to be driven high for link up to complete.</p>	<ul style="list-style-type: none"> Workaround: None available. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>The Intel FPGA PAC D5005 reports a preset QSFP temperature threshold value irrespective of what is specified in the QSFP module data sheet.</p>	<ul style="list-style-type: none"> The Intel FPGA PAC D5005 reports a QSFP module temperature of 70C for upper-non critical threshold and 90C for upper non-recoverable threshold regardless of what the specified value is for that QSFP module. Workaround: Monitor the QSFP temperature reported by the sensors to ensure the module is not exceeding operating conditions defined in the QSFP module's data sheet. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p><code>fpgainfo bmc</code> may not return QSFP Supply Voltage if your QSFP module does not support supply voltage registers.</p>	<ul style="list-style-type: none"> The Intel MAX 10 BMC obtains the QSFP voltage sensor value from the Supply Voltage registers beginning at offset 26, as listed in the Free Side Monitoring Values Table 6-7, of the SFF8636 Specification for Management Interface for 4-Lane Modules and Cables, rev2.10a. Workaround: If your QSFP module does not support this register please disregard the value returned by the Intel MAX 10 BMC when using the <code>fpgainfo bmc</code> command. Status: No fix.
<p>If <code>pacd</code> is killed before it recovers from a sensor trip, <code>fpgasupdate</code> or other accesses to the FPGA may fail.</p>	<ul style="list-style-type: none"> Workaround: Resetting the FPGA is the only way to recover from the failure. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>Running the OpenCL example may give a segmentation fault.</p>	<ul style="list-style-type: none"> Including the parameter <code>default_hugepagesz=1G</code> creates the error. Workaround: Remove the parameter <code>default_hugepagesz=1G</code>. Status: Fix targeted for a future version of the Intel Acceleration Stack.

continued...

Known Issue	Details
<p>A partial reconfiguration (PR) compile using OpenCL may produce hold time violations in the static regions.</p>	<ul style="list-style-type: none"> Workaround: Recompile using a different seed with the command: <pre data-bbox="786 352 1409 380">aoc <kernal_name.cl> -seed=<integer></pre> For example: <pre data-bbox="786 426 1409 453">aoc hello_world.cl -seed=5</pre> Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>PCIe* bandwidth limitation with OpenCL designs.</p>	<ul style="list-style-type: none"> PCIe Gen3x16 operates at a lower throughput than expected only with OpenCL designs. Workaround: None available. Status: Fix targeted for a future version of the Intel Acceleration Stack.
<p>PACSign tool requires installation of Python* version 3.x through the rpm process.</p>	<ul style="list-style-type: none"> Installation of Python* verison 3.x from source is not accepted by PACSign. PACSign looks for python 3.x in rpm repository. Workaround: You must install Python3 using the following command before installing the Acceleration Stack for Runtime or the Acceleration Stack for Development. <pre data-bbox="786 804 1409 831">sudo yum install python3</pre> Status: Fix targeted for a future version of the Intel Acceleration Stack.

Known Issues for the Intel Acceleration Stack v2.0.1 AFU Design Examples

Table 5. Known Issues for the Intel Acceleration Stack v2.0.1 AFU Design Examples

Known Issue	Details
<p>The <code>streaming_dma_afu_unsigned.gbs</code>, <code>dma_afu_unsigned.gbs</code> show timing violations that may limit their operation.</p>	<ul style="list-style-type: none"> • Workaround: No workaround available. • Status: This limitation will be fixed in a future patch of the Intel Acceleration Stack.
<p>The Intel Quartus Prime Pro Edition compilation report for <code>hello_mem__afu_unsigned.gbs</code> displays Fmax and slack times incorrectly.</p>	<ul style="list-style-type: none"> • Workaround: To view the correct timing, open the results in the Timing Analyzer tool or in the timing reports found in <code>/output_files/timing_reports</code> for the final timing reports of the design. • Status: This limitation will be fixed in a future version of the Intel Acceleration Stack.
<p>After a partial reconfiguration of a <code>dma_afu_unsigned.gbs</code> or a <code>streaming_dma_afu_unsigned.gbs</code>, First Malformed Req is set in the PORT errors output.</p>	<ul style="list-style-type: none"> • Workaround: To clear the errors , you must power cycle the Intel FPGA PAC. • Status: This limitation will be fixed in a future version of the Intel Acceleration Stack.
<p>Running the <code>fpgabist</code> command on <code>n1b_mode_3_unsigned.gbs</code> reports incorrect output.</p>	<ul style="list-style-type: none"> • Instead of reporting the output of a throughput test, a default BIST test runs. • Workaround: Load the <code>n1b_mode_3_unsigned.gbs</code> bitstream. Complete the steps below to get read, write and read-write combined bandwidth: <pre data-bbox="760 957 1386 1142"> \$ fpgadiag -B -D -F --mode=read --read-vc=vh0 --write-vc=vh0 --multi-cl=4 --begin=1024 --end=1024 --timeout-sec=5 --cont \$ fpgadiag -B -D -F --mode=write --read-vc=vh0 --write-vc=vh0 --multi-cl=4 --begin=1024 --end=1024 --timeout-sec=5 --cont \$ fpgadiag -B -D -F --mode=trput --read-vc=vh0 --write-vc=vh0 --multi-cl=4 --begin=1024 --end=1024 --timeout-sec=5 --cont </pre> • Status: This limitation will be fixed in a future version of the Intel Acceleration Stack.

Revision History for the Intel Acceleration Stack for Intel Xeon CPU with FPGAs v2.0.1 Release Notes

Date	Acceleration Stack Version	Changes
2021.06.14	2.0.1 (compatible with Intel Quartus Prime Pro Edition v19.2)	Removed the following sections: <ul style="list-style-type: none">• <i>Resolved Issues from Intel Acceleration Stack v2.0 to v2.0.1</i>• <i>Resolved Issues from Intel Acceleration Stack v2.0 to v2.0.1 AFU Design Examples</i>
2019.12.26	2.0.1 (compatible with Intel Quartus Prime Pro Edition v19.2)	Added a new known issue: <i>PACSign tool requires installation of Python* version 3.x through the rpm process.</i>
2019.11.04	2.0.1 (compatible with Intel Quartus Prime Pro Edition v19.2)	Initial release.
